

INTELLIGENT BABY ROCKER

In the present world, where the parents would be busy leading their professional life, it is difficult for them to find sufficient time for their baby. Also it is the general customary of the society that the mother have to take care of the baby, along with their professional and family life. But the babies cry often during their sleep and can be soothed back to sleep by rocking the cradle, in most cases. This requires lots of physical effort and time of the mother, which doesn't promise a lively mother care. An Intelligent Baby Rocker which swings automatically after detecting the baby cry is, to an extent, a great relief for working parents. Considering the fact that the baby cannot be left unattended, and needs ultimate care, the system is equipped to check for the conditions where attention is required. A camera is also incorporated in the system, to track the events. I-Baby Rocker is one which can be extended to neonatal departments in hospitals and also to the daycares. As in these areas there might be many babies and a few care takers to attend them.
